MERGING
URBAN SCALE
WITH
HUMAN SCALE

A1

Hong Kong High DensCity

thesis, Master of Architecture, *graduation project, awarded distinction*

length approx. 8 months

advisor prof. Benjamin Gianni

language english

Urbanization and civilization go hand in hand. Human beings have, over time, largely transitioned from a nomadic to more sedentary, urban way of life. Cities however tend to generate and incite their own forms of movement, both horizontal and vertical.

Cities are living organisms.

In order to function and grow they require air, light, water: they must breathe, accommodate continuous flow, sustain incessant renewal.

While cities throughout time have struggled with high densities and overpopulation, these challenges are also proof of their attractiveness. Liveliness, diversity and spontaneous encounters ensure the city's appeal.

The high-densities of mega cities make it both necessary and possible to pursue extraordinary infrastructures (sometimes "over the top"?) to address with congestion; there will always be people to occupy the space. The crowd/mass dictates both the evolution of the built environment and the nature and extent of urban circulation systems.

On the one hand, cities must adapt to the modes and routes along which its residents wish to travel; on the other hand, they must manage them. In extreme cases cities must also deal with challenging topography as, for example, those that occupy narrow bands of land trapped between the mountains and the sea. Space constraints not only push buildings together but upward, further increasing the density. The more people that occupy a city, the more challenging it is to manage the movement of people. The combination of high densities and robust topography is what produced the network of elevated walkways in the central business district of Hong Kong Island.

This thesis researches an as-yet-unrealized but inevitable fourth generation (4G) circulation system for Hong Kong's downtown core. While primarily for pedestrians, this new circulation layer will be physically and functionally distinguishable from the city's current network of elevated walkways. While the latter only brushes past towers' façades, this proposal named the Long Line has the audacity of merging with the architecture, refurbishing in consequence its interior layout.

人山人海

pronounced *rénshān rénǎi* is a Chinese idiom meaning *mountains and seas of people* in other words a vast/dense crowd or in other words: Hong Kong.

走街串巷

pronounced *zǒujiē chuànxiàng* is a Chinese idiom meaning *walking through streets and alleys* what the Long Line offers in complete continuity.

«WHAT COULD BE MORE
ABSOLUTE THAN
SILENCE?»

-HONORÉ DE BALZAC

A2

library for downtown Ottawa

Master of Architecture, individual project

length approx. 3 months

advisor prof. Claudio SGARBI

language english

The site was bounded by two parallel streets which is why I decided to link the latter by creating a new inner street. This altered the regular existing grid but also introduced a new type of façade for the downtown urban street.

The library is divided into two opposing parts:

-one long SILENT volume, horizontal in design, when regarding to the materials used but also the structure (concrete and wood). This side offers areas of «absolute» silence for work, research and offices for staff. The latter are the «boxes of silence».

-another long LOUD volume, vertical in its form, surface but especially by its non-interrupted metallic structure from ground to top floor. This permits the acoustic waves to travel from the loud main entrance across the horizontal plans. This volume also holds the functions that generate loud sounds such as cafeteria, children's floor, shops, restrooms... This volume becomes the backstage of a scene that is observed by spectators on the other side, the silent volume. It is an ajustable space that offers multiple uses for a designated space thanks to its metallic vertical structure.

Both volumes, that can be incorporated as the two lungs of the project, meet at the center, the inner street that brings life to the project. The physical heart of the project is hollow and silent. It curves into a sculptural shelf for the library's basement storage. The latter is visible and accessible from the inner street that penetrates the building.

«CINEMA IS A MATTER OF
WHAT'S IN THE FRAME AND
WHAT'S OUT.»

-MARTIN SCORSESE

A3

fragmented film museum in Marfa, Texas

Master of Architecture, individual project

length approx. 2 months

advisor prof. Bud BRANNIGAN

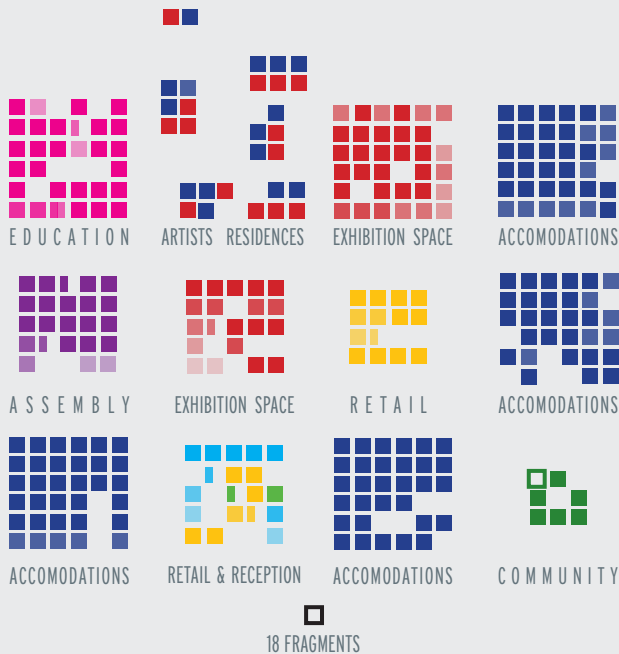

language english

The project is an urban one but working with 3 different scales. From City-scale, to site-scale and finally to fragment-scale, the concept is kept intact. It is a film museum which is why the initial thought was of eadweard muybridge and his series of frames depicting a horse galloping. Still frames can interpret movement. How can a building do the same? The idea is to find a logical sequence to these fragments that compose the museum. This logic is density. beginning near to the center of the city where density is high, the museum fragments respect this density. Further south, the grounds become vaste as do the museum buildings. The grid is the same all the way however it is less filled with vertical panels. The latter are varied in function, colour, material, opacity and number. They can become panels for an exhibition, panels to project on, panels to separate or to unite.

These panels are adjustable and easily removable. If transparent, they are able to frame the exterior (or interior of the building), sky or grounds.

The north gallery is the fifth fragment of the museum. It introduces the idea of merging exterior and interior especially by the use of sliding, swinging, adjustable doors (bondor panels). The succession of vertical panels is at a high frequency, thus creating high density of building. The exhibition space is a grand area with preparation rooms and storage.

The south gallery is the twelfth fragment of the museum. The ambiguity between what is exterior and what is interior is greater than the north gallery. The environment is less dense and a whole half of the proposed grid for each fragment is kept void of building to give visitors the opportunity to discover the building's long façade from the exterior. This is how the building becomes part of the exhibition.

«THE GARE SAINT-LAZARE:
ARRIVAL OF A TRAIN»,
1877

-PAINTING BY CLAUDE MONET

A4

train station (Grand Paris Express)

Bach. 3rd year individual project

length approx. 4 months (1 month research, case studies)

advisor prof. Jim NJOO

language french

We worked on the analysis of the Grand Paris and concentrated on train stations for 4 weeks. The project which lasted 2 months was the establishment of the train station Champigny-Centre (connection between 2 subway lines) in the Eastern suburbs of the capital city. Varied functions accompanied the underground station such as a school, housing, multimedia library, offices and commercial areas. One of the particularities of the site was the existing freight rails that cut the site in half, perpendicular to the principal avenue. My project develops an urban stratification, underground and overground, and works on this creation of a void/mass pattern to bring in light where needed and as an indicator of access.

5 storey housing

Bach. 3rd year individual project

length approx. 3 months

advisor prof. Christian LABBÉ

language french

Before the assembly of 12 apartments, three types were previously established (1 month first part of the project) and eventually multiplied to fill the 5 upper stories of a non existing building with a square base of 25x25m. The initial idea that I followed up until the final rendering was that of the «foyer» which in French can have many connotations, it can mean center, household, or fireplace (reference to Frank Lloyd Wright's hearth of the prairie house).

Inside the apartments, the «foyer» becomes the kitchen, strategic point of reference. However at the scale of the assembly of the apartments, this notion is illustrated by the common areas that are brought alive by an active circulation (mix of stairs and access ramps that accentuate the movement from one side of the initial square to the other).

A 6

30x30 museum

Bach. 2nd year individual project

length approx. 3 months

mentor prof. Pascal QUINTARD-HOFSTEIN

language french

The first guidance of the project was a hypothesis (theme, here being carousel) to establish personally, first working with light itself and eventually through a juxtaposition of elements (9 poles which later became 25 and a horizontal plane eventually combined with a ceiling covering two levels).

It was only a month after the start of the project that it was announced that the program was a small museum of 30x30m (average), mainly offering 3 halls of exhibition.

My first intention was to clear the plan (delimitation of 30x30m) of any stairs. I was encouraged to pursue this idea, the stairs becoming an access ramp, purposely exaggerated. It was a way to re-enter the museum (visitors or light) and adding value to the promenade from one floor to the other.

MY ADVICE TO A YOUNG ARTIST,
YOUNG ARCHITECT, IS FIRST OF ALL,
IS ARCHITECTURE WHAT YOU
REALLY WANT TO DO MORE
THAN ANYTHING ELSE IN THE
WORLD AND YOU WOULD DO ANYTHING
TO BE ABLE TO DO IT BECAUSE IT
REALLY FIRES YOU? IF THAT IS
THE CASE YOU'VE MADE THE RIGHT
CHOICE AND YOU GO FOR IT AND YOU
IMMERSE IN IT, TOTALLY SATURATE IT,
**YOU LIVE IT
EVERY LIVING SECOND
OF YOUR LIFE.**

SIR

NORMAN

FOSTER
